

Here we will try to transpose the size of the planets to human scale so that you can really appreciate the dimensions of these stars. Here's a table summarizing the size of the various planets on a human ...

The Sun, the 8 official planets in our solar system (Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus and Neptune) and the dwarf planet Pluto, are each entirely unique in their orbiting patterns, ...

These lists contain the Sun, the planets, dwarf planets, many of the larger small Solar System bodies (which includes the asteroids), all named natural satellites, and a number of smaller objects of ...

Any natural solar system object other than the Sun, a planet, a dwarf planet, or a moon is called a small body; these include asteroids, meteoroids, and comets.

But in fact, we're embedded in a huge Solar System that extends across a vast amount of space. Which begs the question, just how big is the Solar System?

Online 3D simulation of the Solar System and night sky in real time - the Sun, planets, dwarf planets, comets, stars and constellations

Compare the sizes of the planets and sort them by order from the Sun or by size. See their mass, gravity, moons, distance from Earth, and composition.

Saturn, known for its spectacular icy rings, is the second largest planet in our solar system. It's about nine times wider than Earth, with an equatorial diameter of about 74,898 miles ...

The size of planets in our solar system varies dramatically. Let's explore the sizes of the planets, including their radius and diameter in both kilometers and miles, and their relative sizes ...

The Solar System currently moves through a cloud of interstellar medium called the Local Cloud. The closest star to the Solar System, Proxima Centauri, is 269,000 AU (4.25 ly) away. Both are within the ...
