Abstract--This paper presents an overview of technology related to on-board microgrids for the More Electric Aircraft. All aircraft use an isolated system, where security of supply and power density ...

This paper primarily focuses on researching the interaction technology between electric aircraft and airport microgrids, aiming at optimizing electricity usage for future electric aircraft at small ...

This paper presents the development of an airport bipolar DC microgrid and its interconnected operations with the utility grid, electric vehicle (EV), and more electric aircraft (MEA).

We propose an integrated electricity-thermal-hydrogen microgrid that incorporates photovoltaics, hydrogen fuel cells, and multiple energy storage systems to reduce reliance on the ...

The interaction between electric aircraft airports and microgrid technologies is expected to be a key focus in the future development of electric air- craft. Optimizing the operation of airport microgrids ...

The future microgrid energy system for the airport will adopt large-scale distributed energy resources (DERs). The DERs such as PVs and wind turbines (WTs) are proposed to supply clean energy to the ...

To cater to the advancement of electric and hydrogen-powered aircraft, airports are increasingly motivated to transition to green multi-energy airport microgrid

In this work, a bi-objective infrastructure planning framework for airport microgrid to accommodate parking lot electric vehicles (EVs) and EA is developed, and the impact of V2G on the...

Here, we study how exergy, the amount of useful energy throughout a system, can guide control design and system operation. A multi-physics networked microgrid model was developed of ...
